

Saved items already show intent. Thirty-day conversion still fails without a coupon.

Myntra · Growth PM · Wishlist-to-Purchase in 30 days · no monetary incentive as the core lever

Constraint	What it rules out
No coupons	A discount is not a product win
No sale alerts	EOSS nags do not finish a judgement
No price-drop nags	Waiting is not the 30-day strategy

WHY THIS FIRST

A wishlist is explicit interest that stalls. Discover why they wait — then finish the judgement. Do not pay for the buy.

North star: share of users who buy ≥1 wishlisted item within 30 days of saving it.

PROBLEM STATEMENT Intent is captured. A decision is not. The only in-app move on offer is a falling price.	BUSINESS OUTCOME W2P 30d rises through decision completion at full price — not through margin given away.	PRODUCT OUTCOME Shortlist-to-decision (buy or drop). Removals count. A coupon tap does not.
--	---	---

W2P 30d only moves if shoppers return, finish a judgement, then act

W2P 30d = buyers of ≥1 wishlist item in 30 days ÷ users who saved ≥1 item.

1

Revisit

Open the wishlist within 30 days. If they never return, nothing converts.

Necessary. Not the bet.

2

Resolve · secondary

Fit, quality, look. Real — and not the decider after research.

Ships with Decide.

3

Decide · primary

Chosen node

Buy or deliberately drop among 2+ similar saves. Removals count.

4

Act

Bag / checkout. A coupon tap does not count as a win.

Last step, not the lever.

Price-waiting is **ranked** so we do not pretend it is rare. It is **set aside** because the brief forbids paying for conversion. An MVP may only target Resolve and Decide.

What they already do (Q11, n = 9)

Read reviews

8/9

In-app compare

6/9

Wait for a sale

2/9

Signal for the tree

Research is the default ritual. Waiting is the minority act. Rank sale-wait; do not build it. Target Resolve and Decide.

Revisit × Resolve × Decide × Act — Discovery informs ranking; the MVP never targets a discount.

Public shopper voice becomes ranked opportunities, not a sentiment chart

Discovery engine · 1-slider. Sentiment-only output fails Part 1.

Why this engine: live public voice, quote-grounded themes, scored without paying for conversion. Empty cells stay empty. No invented lines.

- 1 Collect**
App Store, Play Store, Reddit, YouTube, forums — saving and waiting.
- 2 Keep**
Drop short 503 · off-topic 239 · dupes 3. Keep save, fit, compare, wait.
- 3 Group**
Quote-grounded themes. ≥2 quotes. Map to Q1–Q10. No invented lines.
- 4 Score**
0.4 impact + 0.4 feasibility + 0.2 frequency. Empty stays empty.
- 5 Gate**
Price-flagged rows ranked, then excluded. Lock only after research.

Fit ranked first. Sale-wait is #2 — and we still will not use it.

895 reviews read · 150 about saving or waiting · 12 patterns compared · readyForPhase2

RANK 01 · NOMINATED

0.87

Fit and size

~37% of kept comments. Nominated. **Not locked.**

RANK 02 · PRICE-FLAGGED

0.83

Waiting for a sale

Counted. **Not the MVP.**

RANK 03 · RESEARCH KEPT

0.82

Choosing between saves

Decide-side partner. Primary after lock.

Score bars · 0.4 impact + 0.4 feasibility + 0.2 frequency

What the scrape also said

Ranks 4–6 sit at 0.82 (style, compare-difficulty, occasion). Return fear is 0.72 at ~38% of kept comments — resolve-side, not the lock. Two price-flagged rows (#2 and #12). Ranking: [studio?view=focus](#)

Shoppers say price. Asked for help, they want a verdict — not a coupon.

Primary research · questionnaire n = 9 · 28–31 Aug 2026 — not 5–6 live interviews

Before they buy a save (Q11)

Help requested (Q13 — no discount option)

Load-bearing switch

Q12: discount 4 vs information 5. Q13: “is this price good?” 4/9; pick among saves 2/9. **All four discount-seekers switched to information** — including both in-segment respondents.

Caveat, labelled

2 of 9 match the stalled shortlister (target 5). Price was not held constant. Closed-option form — no invented quotes. Myntra 7/9.

[Open the form](#) · [/survey](#)

Problem proven in behaviour, not in a coupon request. Next: lock the problem. →

The stalled shortlister cannot finish a judgement inside the wishlist.

Locked problem · stalled shortlister · no monetary incentive

Neither *which of these* nor *is it worth what it costs*. The only tool the app offers is a falling price. Intent parks on a sale that may never arrive in 30 days.

Price is the symptom of a missing judgement aid — not a demand for money.

1. Segment

Saves, returns, leaves without deciding. Sale-watchers are a control, not the audience.

2. Primary

Shortlist-to-decision. Buy or drop. Removals count as success.

3. Secondary

Uncertainty resolution — fit / quality from other shoppers. Ships with Decide.

4. Falsify

Hold price constant. If it still wins in segment — **stop. Do not ship a coupon.**

W2P → revisit / resolve / decide / act → scrape (fit #1) → questionnaire (decide + value confidence) → lock. Tree: proceed, re-scoped — without an incentive.

Confirmed in the 9

9/9 have an unbought save. Compare shows up three ways (save 4/9 · Q11 6/9 · help 3/9). Reviews 8/9. Confidence mean 2.89.

Challenged in the 9

Clutter: 6/9 hold only 1–5 saves. Fit as #1 barrier: 0/9 name it as the main unbought reason. Sale-wait is widespread in Q7 (6/9) but only 2/9 act on it.

Studio finishes the call with a room and a coach — never a coupon

Four solutions on the shopper path. Recs + discount rejected. Q14 does not support “AI picks winners” (mean 2.89).

Rejected

Recs + discount
Paying for the buy is forbidden. A recommendation feed plus a coupon is not a judgement aid.

Rejected

Sale alerts / EOSS nags
Price-drop waiting is ranked #2 so we do not hide it — and still will not ship it.

Rejected

AI that picks winners
Q14 mean 2.89. The coach asks three questions. It does not name a winner.

Chosen

Studio room + coach — decision-first, fit secondary, worth as cost-per-wear.

1 Save similar

Two or more of the same kind. /wishlist

2 Hang two

Same rack. Price off. /studio? view=room

3 Keep one

Tap bust, length, or foot. Size from shopper notes.

4 Ask the coach

Fit · wear · worth. Groq may rephrase. Never a discount.

Why this: comparison is confirmed three ways. Value confidence is the top requested help. Guardrails: evidence ids, confidence bands, not guarantees. Forbidden in code: coupons, EOSS, urgency.

Decision-first · fit secondary · value as wears. Next: one storefront to test. →

One storefront to test: discovery, room, and coach

Working React storefront. Production: Netlify. Run locally after npm run dev.

Layer	What ships
Client	Shop → wishlist → Studio room → coach (fit / wear / worth)
API	Ingest · analyze · compare · value · events
Intelligence	Quote-grounded scrape → rank 0.4 / 0.4 / 0.2 → Groq
Data	themes.json, ranking, survey, problem lock. SQLite in Phase-5
Deploy	Netlify (netlify.toml). Test: cd Phase-1 && npm run dev
Metric hooks	coach_opened · compare_completed · cart_add_simulated — proxies. Worth tile = cost-per-wear, not a lower ticket.

[room](#) · [coach](#) · [stories](#) · [survey](#) · [form](#)

A finished decision is a win. A coupon tap is not.

One north star, two product outcomes, leading indicators, guardrails. Demo flags are proxies.

NORTH STAR · W2P 30D

Buyers ÷ savers

Buyers of ≥ 1 wishlist item in 30 days ÷ savers. The brief. Demo cart/purchase flags are **proxies**.

A coupon tap is not this metric.

Primary · Decide

Shortlist-to-decision: bought or deliberately dropped in 30d ÷ saves.

Secondary · Resolve

Uncertainty resolution: doubt-cleared items ÷ items with a recorded doubt.

Leading

Wishlist reopen. Coach opened or keep-one completed ÷ eligible shortlists.

Guardrails

Coupon clicks $\neq$ success. Return rate must not rise. Time-to-bag must not worsen.

Kill if follow-up talks hold price constant and price still dominates in segment. Removals count as a completed decision. Demo flags: coach_opened · compare_completed · cart_add_simulated — proxies only.

We now know what success looks like. Next: what could go wrong and how we handle it. →

Thin segment. Still-binding price. Fake certainty.

Failure modes and risk mitigations · decision tree is executable · incentiveMvpAllowed is false

What could go wrong	How it's handled
In-segment n = 2 — both asked for a discount on Q12	Label it. Recruit stallers. Ask Q3/Q4 with price frozen.
Price is actually binding — constraint conflict becomes terminal	The tree already says stop , not coupon.
LLM / hybrid gaps — 3 extract batches failed	Quotes must match text. Empty cells stay empty. Rule-based first on coach.
App-store noise — delivery swamp the hesitation moment	Drop ops reviews. Do not treat post-delivery fit as pre-purchase proof.
Oracle framing — Q14 mean 2.89	Coach asks three questions, not a winner. No urgency.

GUARDRAILS

- Critical

If price still dominates with price held constant — stop.
- n = 2: do not over-claim the segment until stallers are recruited.
- Next: a handful of moderated stalls. If a verdict still wins, keep the room and the coach.
