

Saved items already show intent. Thirty-day conversion still fails without a coupon.

Myntra · Growth PM · north star is Wishlist-to-Purchase in 30 days · no monetary incentive as the core lever

NORTH STAR
W2P 30d = users who buy ≥ 1 wishlisted item within 30 days of saving it $\div$ users who saved ≥ 1 item.

CONSTRAINT
No coupons, cashback, sale alerts, EOSS nags, or price-drop waits as the product. Paying for the buy is not a win.

THE JOB
A wishlist is explicit interest that stalls. Discover *why*, then help them **finish a judgement** inside the list.

What the shopper is missing (user value)
A **defensible choice** — why this save, not the other two. A **defensible price** — whether the ask is fair for what it is. **Fewer open loops** — no YouTube detour before ordering. **Lower risk of being wrong** — fit and quality from other shoppers at the moment of doubt. Confidence is the mechanism; the felt benefit is **closure**.

What the business gets if that is right
W2P 30d rises through **decision completion at full price**, not margin given away. Return-rate exposure falls where fit is resolved before try-and-buy. Demand can move out of sale weeks if waiting is a default caused by a missing judgement aid — not a demand for money.

W2P 30d only moves if shoppers return, finish a judgement, then act

Metric tree from the architecture: Discovery informs ranking. An MVP may only target Resolve and Decide — never a discount.

1 Revisit

Definition: open the wishlist within 30 days of a save.

Rationale: if they never return, nothing converts. Necessary. Not the bet.

2 Resolve · secondary

Definition: blocking doubt (fit, quality, look) is gone.

Rationale: scrape ranked it #1; research keeps it real and not the decider. Ships with Decide.

3 Decide · primary **Lock**

Definition: among ≥ 2 similar saves, buy **or** deliberately drop in 30 days.

Rationale: comparison is the only lever confirmed three independent ways. Removals count as success.

4 Act

Definition: wishlist item → bag / checkout in 30 days.

Rationale: last step. A coupon tap is not this metric and is not a win.

Why Decide outranks Resolve in the lock

Counting respondents once per node: Decide **8/9**, Resolve **7/9**. The margin is one person — so Resolve still ships. The case for Decide-first is the unlock-versus-help evidence, not that share alone.

Sale-watchers (S3) stay a **control**, not the audience. Segment is S4-led (compare) with S2 (fit) secondary.

Price-waiting is ranked — then set aside

The scrape put sale-wait at rank **2 / 0.83** and sale-waitlist at rank **12 / 0.39**, both price-flagged. They are counted so we do not pretend waiting is rare. They are excluded from the MVP because the brief forbids paying for conversion.

W2P 30d ← Revisit × Resolve × Decide → Act. Discovery ranks; the product only builds the non-monetary nodes.

Public shopper voice becomes ranked opportunities, not a sentiment chart

1-slider. Quote-grounded themes, scored, compared. Sentiment-only output fails the brief. Empty cells stay empty.

1 Collect

App Store RSS, Play Store, Reddit, YouTube, forums, Myntra reviews — saving, fit, compare, wait.

2 Keep

Drop <8 words, off-topic, SHA-256 dupes. Keyword gate: wishlist, size, return, sale, compare, occasion.

3 Group

≥2 quotes per theme, map to Q1–Q10, tag metric node (revisit / resolve / decide / act). No invented lines.

4 Score

$0.4 \times \text{impact} + 0.4 \times \text{non-monetary feasibility} + 0.2 \times \text{frequency}$. high = 1 · medium = 0.6 · low = 0.3.

5 Gate

Price-flagged rows ranked, then excluded from the bet. No product lock until primary research.

Kept		150

How a reviewer tests this (and what we will not hide)

Sources in the 895: App Store 568 · Play Store 303 · Reddit 10 · YouTube 3 · forum 3 · Myntra review 2 · other 6. Method: hybrid — 3 LLM batches failed, 7 themes gap-filled. 12 validated themes, 0 rejected, Q1–Q10 covered. Validation: every quote must resolve to a review id; <2 quotes rejects the theme; high confidence needs ≥2 sources. Test on production: [live voices](#) · [Q1–Q10](#) · [what to focus on](#)

Fit ranked first. Sale-wait is #2 — and we still will not use it.

895 → 150 → 12 compared. Ranking nominated fit / size anxiety → resolve. That is a nomination, not the lock.

RANK 01 · NOMINATED

0.87

Fit and size · resolve · ~37% of kept comments.
High impact, high feasibility. **Not locked.**

RANK 02 · PRICE-FLAGGED

0.83

Waiting for a sale · decide node, but monetary.
Counted so waiting is not hidden. **Not the MVP.**

RANK 03 · RESEARCH KEPT

0.82

Choosing between saves · decide. Decide-side partner. Becomes primary after the lock.

#	Opportunity	Score	Node	Note
1	Fit / size	0.87	Resolve	Nominated
2	Sale-wait	0.83	Decide	Price-flagged
3	Compare saves	0.82	Decide	Kept
4	Style doubt	0.82	Decide	
5	Compare difficulty	0.82	Decide	
6	Occasion / styling	0.82	Resolve	

#	Opportunity	Score	Node	Note
7	Return fear	0.72	Resolve	~38% of kept comments
8	Wishlist decay	0.65	Revisit	Confirmed later
9	Review trust gap	0.65	Resolve	Confirmed later
10	Bookmark vs intent	0.49	Revisit	
11	Social validation	0.49	Resolve	
12	Sale-waitlist	0.39	Revisit	Price-flagged

Two price-flagged rows (#2 and #12) are labelled — colour is not the only signal. Ranking: [studio?view=focus](#). Next: what shoppers said when asked. →

Shoppers say price. Asked for help, they want a verdict — not a coupon.

Structured questionnaire n = 9 · 28–31 Aug 2026 — not 5–6 live interviews. Closed options, so counts not sentences. No invented quotes.

Who answered	Count
Myntra among platforms (Q1)	7/9
Uses a wishlist (Q3)	6/9
Holds only 1–5 saves (Q4)	6/9 — clutter challenged
Has an unbought save (Q6)	9/9
Strict stalled shortlister (target 5)	2/9 — R03, R07

Load-bearing switch

Q12 unlock: discount 4 vs information 5. Q13 has no discount option. All four discount-seekers (R01, R03, R05, R07) asked for information — three for “is this price good?”, R05 for compare. Both in-segment stallers are in that four.

What they do before buying a save (Q11) — behaviour, not slogan

Q8 main unbought reason: price-shaped 5/9 · fit as the *main* reason 0/9. Q9 confidence mean 2.89. Q14 “AI picks winners” mean 2.89 — framing dropped.

Help requested (Q13) vs how discovery fared

The stalled shortlister cannot finish a judgement inside the wishlist.

Lock generated from artefacts, not typed by hand · incentive Allowed is false

A wishlist captures interest but offers no way to finish a judgement — neither *which of these is right for me* nor *is this worth what it costs*. The only decision tool the app offers is a falling price, so intent parks on a sale that may never arrive in 30 days.

Price is the symptom of a missing judgement aid — not a demand for money.

Segment

Stalled Shortlister. Saves, returns, leaves without deciding. Eligibility: ≥ 2 saves in 30 days, ≤ 1 purchased, ≥ 2 of the same kind. Floors lowered from 3 because 6/9 hold only 1–5 saves. Sale-watchers are a control, not the audience. In-segment $n = 2$ — labelled.

Primary · Decide

Shortlist-to-decision rate: bought **or** deliberately dropped in 30 days. Removals are a success, not a leak. A metric that only rewards purchases would push pressure tactics — the same failure as a discount.

Secondary · Resolve

Uncertainty resolution: fit / quality from other shoppers at the moment of doubt. Must ship with Decide. Return fear was 38% of kept comments — resolve-side, not the lock.

Required · still unbuilt

Value confidence: “is this a fair price, and should I decide now?” using non-monetary signals only. Largest evidenced gap. Forbidden: coupons, price-drop alerts, EOSS, urgency.

Decision tree — proceed, re-scoped, no incentive

Price-dominant fired in its non-terminal form: 2/2 in-segment named a discount, price never held constant, but all four discount-seekers still research or compare. **Fork** also fired: Decide outranks Resolve, so the build is decision-first. Clean “proceed as specified” did **not** fire.

How to falsify this lock

Hold price constant (brief Q3/Q4 as written). If price still dominates in segment — **stop. Do not ship a coupon.** Also falsified if stallers name fit as the unlock more often than comparison, or if a fair-price explanation is ignored while discounts still convert.

One Studio tab finishes the call — hang, name the doubt, ask the coach

Decision-first. Room and coach are one shopper path. Q14 mean 2.89 drops “AI picks winners”. Worth is cost-per-wear — a proxy, not a market-price oracle.

Rejected

Recs + discount

Paying for the buy is forbidden. A feed plus a coupon is not a judgement aid and trains EOSS waiting.

Rejected

Sale alerts / EOSS nags

Price-drop waiting is rank 2 so we do not hide it — and still will not ship it. Sale-watchers get no coach entry.

Rejected

AI that picks winners

Q14 mean 2.89, one flat zero. The coach asks three questions. It does not name a winner or add urgency.

Chosen

The studio — one tab on the live storefront. Pick two of the same kind, hang them, name the doubt, then fit · wear · worth. Why this room stays a separate evidence tab.

1

Save similar

Two or more of the same kind.
Matches the segment contract.
[/wishlist](#)

2

Pick two & hang

Same kind, same gender, price off.
One Studio tab — not a second coach screen. [/studio](#)

3

Name the doubt

Tap bust, length, or foot on the body.
Size from shopper notes —
confidence bands, not a guarantee.

4

Ask the coach

Still on that pair, same tab. **Fit · wear · worth** as cost per wear. Then keep one to bag. Never a discount.

Honest gap: value confidence (“is this a fair price?”) is the top requested help and is **not** a market-price verdict in this build. Cost-per-wear is the non-monetary stand-in. Guardrails: evidence ids; <3 reviews → low band; sale-wait takes the look off the hanger; coupons / EOSS / urgency rejected.

One storefront to test: discovery and one Studio path

A finished decision is a win. A coupon tap is not.

Every metric has a definition and a rationale. Demo cart / purchase flags are proxies — labelled as such.

Layer	Metric	Definition	Rationale
North star	W2P 30d	Buyers of ≥ 1 wishlist item in 30 days $\div$ savers	The brief. A coupon tap is not this number.
Primary	Shortlist-to-decision	Bought or deliberately dropped in 30d $\div$ saves	Decide node. Removals close the loop without pressure.
Secondary	Uncertainty resolution	Doubt-cleared items $\div$ items with a recorded doubt	Resolve. Ships with Decide; fit is real, not the unlock.
Leading	Wishlist reopen	Open wishlist in 30d $\div$ savers	Revisit. If they never return, W2P cannot move.
Leading	Room / coach use	Coach opened or keep-one completed $\div$ eligible shortlists	Mechanism. Compare completed $\div$ compare starts.
Guardrail	No paid conversion	Coupon / sale-alert / price-drop click $\neq$ success	Constraint. Incentive MVP is typed false.
Guardrail	Returns and time-to-bag	Return rate must not rise; time-to-bag must not worsen	Honest fit can scare some buys. Overconfident size advice is a failure.

Experiment sketch
Control: standard wishlist (no coach). **Treatment:** locked intervention on eligible segment items.
MDE: set after a baseline proxy exists — do not invent +X pp. **Duration:** 30-day window + 1 week buffer.

Demo flags
Cart and purchase in the demo are labelled simulated. Do not report them as live W2P.

Kill test
Follow-up talks hold price constant and price still dominates in segment $\rightarrow$ the tree says **stop**, not a quieter coupon. Removals count as a completed decision. Session abandonment is a guardrail — nudge fatigue measured separately.

We now know what success looks like. Next: what could go wrong, and the stop rule already written. $\rightarrow$

Thin segment. Still-binding price. Fake certainty.

Solution-specific risks. The decision tree is executable. incentive Allowed is false, so no branch can enable a coupon.

Risk	Why it hurts this solution	Mitigation already in the lock / build
In-segment n = 2	Segment claims rest on R03 and R07. Both asked for a discount on Q12. Target was 5 stallers.	Label every segment claim. Recruit stallers. Do not generalise 2/2.
Price is actually binding	If price still wins when held constant, the constraint conflict is terminal. The root cause is wrong.	Ask brief Q3/Q4 with price frozen. Tree already says stop , not coupon.
Value confidence is missing	Top requested help (4/9 on Q13). Cost-per-wear is a proxy, not “is this price fair?”	Name the gap. Next build is a non-monetary verdict, not a discount banner.
LLM / hybrid gaps	3 extract batches failed; 7 themes gap-filled. Coach prose can invent fit.	Quotes must match text. Empty cells stay empty. Rule-based first; Groq rephrases only.
App-store noise	Public corpus is strongest on post-delivery disappointment, weakest on hesitation.	Drop ops reviews. Do not treat post-delivery fit as pre-purchase proof. Questionnaire carries the lock.
Oracle framing / returns	Q14 mean 2.89. Overconfident size advice can raise returns.	Three questions, not a winner. Confidence bands. No urgency. Return rate is a guardrail.

Stop rule If price still dominates with price held constant — stop.

n = 2: do not over-claim the segment until more stallers are recruited.

Next: a handful of moderated stalls with price frozen. If a verdict still wins, keep the room and the coach.

Studio does not buy conversion. If price is the cause, we stop — we do not ship a coupon.
